Welcome Stephanie from Using Databases with Python

Retrieving GEOData

Download the code from http://www.pythonlearn.com/code/geodata.zip - then unzip the file and edit where.data to add an address nearby where you live - don't reveal your actual location. Then run the geoload.py to lookup all of the entries in where.data (including the new one) and produce the geodata.sqlite. Then run geodump.py to read the database and produce where.js. Then open where.html to visualize the map. Take screen shots as described below.

Please Upload Your Submission:

Screen shot (JPG or PNG - Maximum 1MB) of the geoload.py program running

[Choose File] No file chosen
(Please use PNG or JPG files)

Screen shot (JPG or PNG - Maximum 1MB) of the geodump.py program running

[Choose File] No file chosen
(Please use PNG or JPG files)

Screen shot (JPG or PNG - Maximum 1MB) of the map zoomed into the location that you added.) of your home page.
